Instructions for Cat traps - CSD310/R and CSD440

If trap is supplied with unfitted door insert door inside trap and place open loops over bars marked with colored marker, close loops up with pliers or multigrips and cut cable tie holding latch bar to door

To set trap push latch bar inwards and lift door then with one hand holding the door up use your other hand from inside the trap to pull forward the trigger bar until located inside the metal loop on the door.

First release your hold on the door, the door will now be held open with the trigger bar through the loop. Secondly release your hold of the trigger bar, the trap is now set.

Gently locate trap on level surface and place bait at rear of trap.

Cats: Tinned cat food, sardines, tuna, place in piece of aluminum foil and place in rear bottom of trap. Locate the trap around 50mm to 75mm from a tree or wall to prevent the animal from getting at the bait from the rear of the trap

← All traps are set for normal sensitivity with the small groove in the trigger bar to the top, in situations where a much more sensitive operation is required for smaller animals the trigger bar can be turned with the groove to the bottom.

In this more sensitive situation the trap door may be activated from the animal bumping the trap before it enters. In this mode it is unsatisfactory for cats and possums as both at times will climb on top of the trap looking for a way to reach the bait. Best set up this way when you wish to trap small animals, rodents and mammals,

To turn the trigger bar to the sensitive position insert screwdriver and open the hinge loop

Turn trigger bar over so the groove is to the bottom and close the loop back up with a pair of pliers

CSD310R cat trap with rear door is supplied with a "D" shackle to secure door while in transit

Our Traps are proudly Australian made
